I, LEANNE MYNOTT, MANAGER EXAMINATION SUPPORT AND SALES hereby certify that annexed is a true copy of the Provisional specification in connection with Application No. 2003904006 for a patent by GARFORD PTY LTD as filed on 01 August 2003.

WITNESS my hand this  
Twelfth day of August 2004

A handwritten signature in dark ink, appearing to be 'LM' or similar, written over a horizontal line.

**PROVISIONAL SPECIFICATION FOR THE INVENTION ENTITLED**

***"IMPROVED CABLE BOLT"***

**The present invention will be described in the following statement:**

---

## **TITLE**

### **IMPROVED CABLE BOLT**

#### **FIELD OF THE INVENTION**

5       The present invention relates to an improved cable bolt, in particular to an improved cable bolt adapted for use in coal mining.

#### **BACKGROUND OF THE INVENTION**

10       Cable bolts are steel tendons inserted into bore holes in a rock surface to stabilise the rock surface against collapse. In hardrock mining, the whole length of the tendon is grouted, and a plate is attached to the tendon adjacent to the rock surface. The tendon is then stressed; the plate bears upon the rock surface and thereby stabilises the rock surface.

15       Tendons typically comprise a plurality of steel strands wound together to form the tendon. It is known to provide multi-strand cable bolts that are formed with bulbs or expanded portions in order to increase the surface area of the tendon in contact with the grout to more securely embed the tendon in the grout.

20       In coal mining, where any movement of the rock surface is undesirable, an end portion of the tendon disposed innermost in the bore hole is secured therein by spinning the end portion in resin, attaching a resin damp to an opposing end of the spun end portion, and allowing the resin to cure. The remaining portion of the tendon disposed in the borehole is then tensioned to immediately stabilise the rock surface. The bore hole can then be grouted safely a short time later. In the meantime, the rock surface is stabilised against collapse before grouting commences or during the grout curing period.

When multi-strand cable bolts provided with bulbs or expanded portions are used to stabilise a rock surface of a coal mine, as described above, the bulbs or expanded portions tend to collapse under the load placed on the cable bolt when the tendon is tensioned to stabilise the rock surface. This type of multi-strand cable bolt is thus rendered ineffective as an anchoring means for coal mine rock surfaces, as the collapsed bulbs do not afford sufficient surface area to bond with the grout and the tendon "stretches" or lengthens as the bulbs collapse.

The present invention attempts to overcome at least in part some of the aforementioned disadvantages.

#### **SUMMARY OF THE INVENTION**

In accordance with a first aspect of the present invention there is provided an improved cable bolt comprising a tendon composed of a plurality of strands, the tendon having a plurality of bulbous portions, wherein all the strands in each bulbous portion are spaced apart from one another substantially around the periphery of each bulbous portion, and a plurality of rigid elements, wherein the bulbous portions house the rigid elements.

#### **BRIEF DESCRIPTION OF THE DRAWINGS**

The present invention will now be described, by way of example, with reference to the accompanying drawings, in which:

Figure 1 is a view of a cable bolt in accordance with the present invention; and  
Figure 2 is an upper perspective view of a section taken along the line 2-2 of Figure 1.

#### **DESCRIPTION OF THE INVENTION**

Referring to the Figures, wherein like numerals and symbols refer to like parts throughout, there is shown a cable bolt 10 comprising a steel tendon 12. The tendon

12 is composed of a plurality of outer strands 14 helically wound around a centre strand 15 to form the tendon 12. As shown, there are six outer strands 14 wound around the centre strand 15. The tendon 12 has a plurality of bulbous portions 16 spaced apart from one another along the length of the tendon 12.

5 The portions of the strands 14 and 15, in the bulbous portions 16, are spaced apart from each other around the circumference of the bulbous portions 16, as shown. The section line 2-2 has been taken through the broadest part of the bulbous portion 16. As seen in Figure 2, the centre strand 15 is displaced away from the centre of the tendon 12. Each bulbous portion 16 has a bulb diameter defined as the diameter of  
10 the smallest tube through which the cable bolt 10 will pass. The bulb periphery is indicated by the broken lines, marked 17 in Figure 2. The outer strands 14 and the centre strand 15 are all located adjacent and within the bulb periphery 17.

The bulbous portion 16 houses a rigid element 20 within a cavity 18 defined by the outer strands 14 and the centre strand 15. Preferably, the rigid element 20 is a solid  
15 sphere, such as a steel ball bearing. It is envisaged that there will be minimal clearance between the outermost surface 22 of the rigid element 20 and the broadest part of the cavity 18 of the bulbous portion 16.

In use, the cable bolt 10 is inserted into a bore hole drilled in a rock face. An end portion of the cable bolt 10 disposed innermost in the bore hole is secured therein by  
20 spinning the end portion in resin, attaching a resin damp to an opposing end of the spun end portion, and allowing the resin to cure. The remaining portion of the cable bolt disposed in the borehole is then tensioned to immediately stabilise the rock surface.

When the cable bolt 10 is tensioned or stressed, the load placed on the bulbous portion 16 will be resisted by the rigid element 20 housed within the bulbous portion 16, thereby preventing the bulbous portion 16 from collapsing.

The borehole is then filled with grout, which is allowed to cure and solidify. The grout contacts a greater surface area of the strands 14 in use, as hereinbefore described. The cable bolt 10 is thereby firmly embedded in the grout.

In the meantime, the rock surface is stabilised against collapse before grouting commences or during the grout curing period.

Modifications and variations as would be apparent to a skilled addressee are deemed to be within the scope of the present invention.

DATED THIS 1ST DAY OF AUGUST 2003.
